

## POST-DOC POSITION

Internationally known private clinical and research center in human infertility, located in New York City, has established an additional post-doc level position in its laboratory division. We are looking for a scientist, currently actively involved in molecular level research in genetics, reproductive physiology and/or immunology. Tissue culture and small animal IVF experience is strongly preferred. Our center's career tracks for laboratory as well as physician staff are uniformly double career tracks as providers of clinical services (after appropriate training as embryologists for laboratory staff), and as research scientists. For qualified candidates, this position, therefore, offers a grant-independent scientific career as part of a highly productive and successful research team in reproductive translational research, where acquired knowledge quickly becomes applicable to clinical practice. Salary and benefits are competitive, and the center, in addition, offers generous performance bonuses.

Please submit C.V. to Dr. David Albertini, Lab Director at The Center for Human Reproduction (CHR) at [DAAlbertini@thechr.com](mailto:DAAlbertini@thechr.com). The position is available immediately.
